DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 4/10/06 has been entered.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

2. Claims 1-3, 5-8, 10 and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kurashima (USPN 5,844,585) in view of Mills et al. (US 2003/0035037).

With respect to claims 1-9, Kurashima discloses an apparatus and a method comprising the ink jet recording apparatus using an interleave image forming method, a plurality of recording modes having a different image recording speed on each mode

and varying recording resolution (Column 6: line 39-51, Column 7: line 55-67, Column 8: line 1-5).

However, Kurashima fails to teach using UV radiation curable ink is formed an image, exposure intensity of UV radiation to the ink, varying the intensity, the image is composed of jetted ink having different history of exposure to UV radiation, control which maintains a nearly constant energy amount per unit area of the UV to the recording material and varying the UV corresponding to the image recording speed.

Mills et al teaches teach using UV radiation curable ink form an image (Page 1: [0004]), exposure intensity of the UV radiation to the ink, varying the intensity, control which maintains a nearly constant energy amount per unit area of the UV to the recording material independent of the image recording speed and varying the UV corresponding to the image recording speed (Page 6: [0078]). Also, Mill adjusts number of pulse/sec this can be refer to history of exposure to UV radiation (page 6: 0078])

It would have been obvious to one having ordinary skill in the art at the time the invention was made to vary the UV radiation as taught by Mills. The motivation of doing so is print image at higher rate, resulting in a higher throughput.
